

OPENAI CODEX HACKATHON 2026 • DEVELOPER TOOLS

Website Doctor

Your website, diagnosed in minutes.

An AI-powered website QC platform. Paste a URL — get a full health diagnosis: real crawling, 60+ automated checks, Lighthouse, axe-core, security probes, and AI-written fixes tied to the exact broken elements.

THE PROBLEM

Every website is silently broken. Nobody can afford to find out how.

\$500+

what an agency charges for a one-off site audit — most small businesses never buy one

days

from audit to a report — and it's a PDF of findings, not fixes a developer can paste

7%

conversions lost per extra second of load time — broken sites bleed money invisibly

Free checkers exist — and they're shallow: one page, no context, generic advice, and results you can't trust because failures are silently hidden.

THE PRODUCT

One URL in. A complete diagnosis out.

- ✓ Real 15-stage pipeline: crawl → audits → AI review → fixes
- ✓ Health score + 6 category scores, severity-weighted
- ✓ Every issue: evidence, business impact, copy-paste fix code
- ✓ The actual broken HTML elements, captured from the page
- ✓ Live scan progress over SSE with a real telemetry log
- ✓ PDF export + site-aware AI chat

AI is the engine, not a wrapper.

Vision review

The model reviews every page's real screenshot like a senior designer — CTA contrast, hierarchy, trust signals — findings become issues with the same 1:1 rigor as automated checks.

Markup review

Reads real extracted DOM data and catches what rules can't: weak titles, mismatched schema, suspicious link text — grounded, never invented.

Fix generator

Writes the fix card for each issue using the actual offending element's HTML — page-specific code your developer pastes in, not generic advice.

Grounded chat

Answers strictly from the stored analysis — real scores, real issue names — and refuses out-of-scope questions. Provider-agnostic: Groq, Gemini, any OpenAI-compatible endpoint, zod-validated JSON everywhere.

WHY IT'S DIFFERENT

The honest scanner.

- ✓ **1:1 invariant, DB-enforced** — every failed check = exactly one issue, same severity; counts reconcile in every view
- ✓ **No silent failures** — a check that couldn't run shows orange "Not run — error" with the real reason. Never a fake pass, never a fake 0/100
- ✓ **One-click re-run** — any check or analyzer, offline from stored artifacts where possible
- ✓ **Resolved marks survive re-runs** — the tool respects your triage

Trust is the product. If users can't trust the numbers, an audit tool is decoration.

Every website is a customer.

200M+

active websites worldwide — SMBs, agencies, freelancers who can't afford recurring audits

Freemium

free single scans → paid: scheduled monitoring, multi-site dashboards, white-label PDF reports for agencies

API-first

the scan engine is already an API — CI checks on every deploy, agency bulk scans, embeddable badges

Wedge: agencies. One tool that turns "trust us, your site has issues" into a branded, evidence-backed report with fixes — in the time it takes to make coffee.

From diagnosis to continuous care.

Now → 3 months

- ✓ Scheduled re-scans + regression alerts (“your health dropped 12 points”)
- ✓ Full 331-check industry catalog (62 live today, honestly labeled)
- ✓ Search Console integration — real traffic × real issues

3 → 12 months

- ✓ Auto-fix PRs: the fix generator opens the pull request
- ✓ Agency workspaces, white-label reports, client portals
- ✓ CI gate: fail the deploy if health regresses
